About

I write backends for web applications in Python and TypeScript. I have worked on request management, service booking, document handling and Telegram bots. I design databases, build APIs and connect them to the frontend.

Skills

Main stack: Python, Django, Django REST Framework, TypeScript, Node.js, PostgreSQL, SQL.

Deployment tools: Docker, Docker Compose, Nginx, Git.

Also worked with Go, C#, React, Next.js and Socket.io.

Project experience

- **APIs and access:** built registration, authentication, user accounts and admin panels. Set up role-based permissions and JWT token refresh.
- **Databases:** designed PostgreSQL tables and relationships. Wrote search and filter queries, and SQL functions for pricing and commission calculations. Added sales and stock tracking to a store management application.
- **Documents:** built file uploads and metadata storage. Linked documents to users and groups, and added API endpoints for managing records.
- **Service booking:** built schedules, staff and time selection, and booking statuses. Added an admin panel for managing services, clients and bookings.
- **Bots and integrations:** wrote Telegram bots in Python and Go, command handlers and automated replies. Connected external APIs, and set up notifications and messaging through Socket.io.
- **Deployment and maintenance:** prepared applications for launch with Docker and Nginx. Maintained small-business websites, fixed forms and page layouts across screen sizes.

Education

Peter the Great St. Petersburg Polytechnic University, 2026. Secondary vocational education in Information Systems and Programming.

Languages

Russian - native.
