Profile

I build APIs and integrations for web services. My diploma project covered document uploads and access checks; for a live studio site, I built price and PDF sync with fallback when the source fails. My own tools cover event journaling and Windows diagnostics.

Selected work

Studio website - server-side integrations | 2026

A live service website. DIKIDI handles bookings; the site fetches and validates prices from an external source.

- Refreshed prices every five minutes. On an error or partial response, the site retains the last verified version and marks it stale.
- Synchronized PDFs without deleting the prior copy on failure. Tests cover concurrent requests, invalid data, source failures and restart recovery.

Event processing and external APIs | 2026

A tool for receiving external events and HTTP data with replay after an interruption.

- In Rust, I batched raw events into a segmented journal before decoding them; a bounded channel slows ingestion under load. Tests cover order and overflow.
- In the Python client, I handled 429/Retry-After, per-source cooldowns and deferred work that survives restarts. Tests verify that sources remain independent.

Antiplag - diploma project | 2026

A diploma prototype for coursework documents and groups; the originality-checking algorithm is not implemented.

- Built Bun/Hono uploads for PDF, DOC, DOCX and TXT with type and size checks, PostgreSQL metadata, and document routes with role and owner checks.
- Separated authentication, documents and groups into modules, implemented refresh-token rotation and connected the API to a React UI.

WindowsTweaker - system utility | 2026

A personal C#/ .NET 10 and WPF utility for diagnosing Windows settings.

- Built a no-write plan that checks applicability to the Windows edition and build and shows unknown states explicitly. Separately developed and tested a journaled apply, verify and restore engine; the UI remains diagnostic.

Skills

Backend and data: TypeScript, Bun/Hono, Node.js, Python, PostgreSQL, SQL, HTTP APIs.

Systems: Rust, C#/ .NET, WPF, file journals and diagnostics.

Testing and delivery: automated tests, GitHub Actions, Docker Compose, Git.

Education

Peter the Great St. Petersburg Polytechnic University, 2026. Secondary vocational education in Information Systems and Programming.
